# Unlocking the Power of C++ as a Service: Uniting Python's Usability with C++'s Performance

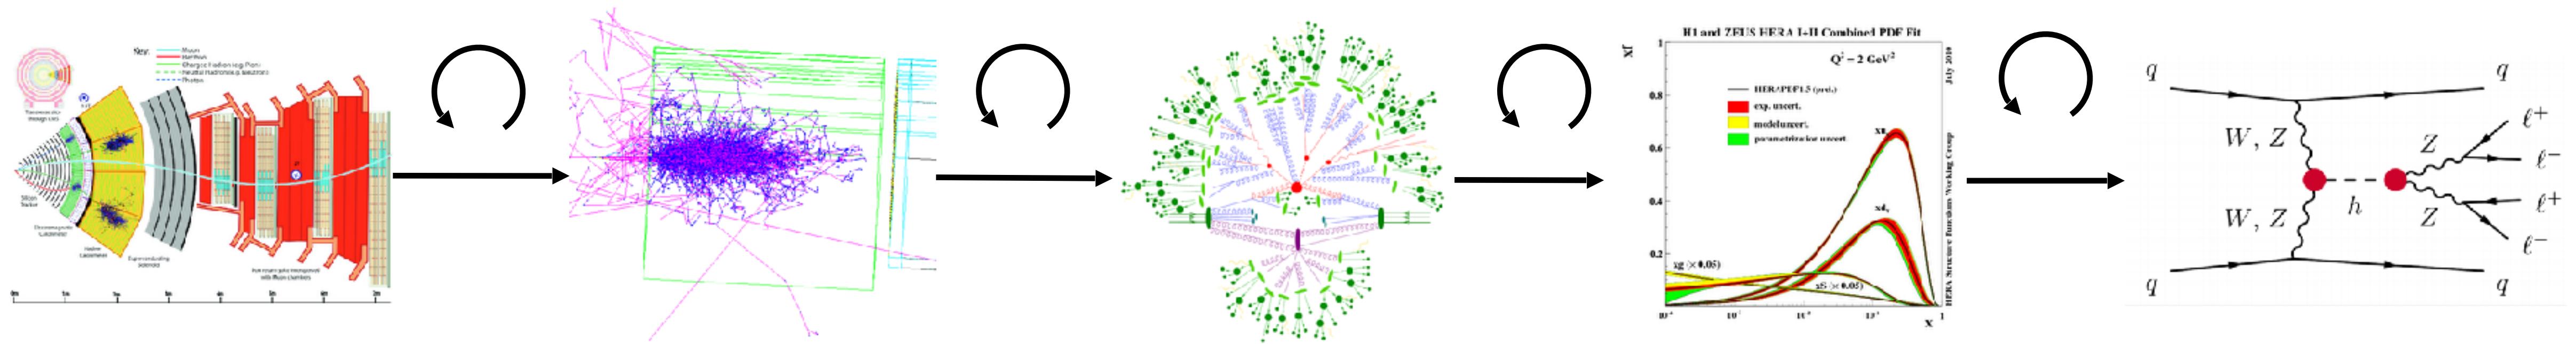

Vassil Vassilev, [compiler-research.org](http://compiler-research.org)

# Motivation

---

Is there a way to combine the expressiveness of Python and the power of C++ without creating a new programming language?

Leverage the exploratory programming infrastructure developed in the field of high energy physics and make it available to other scientific domains via LLVM and open source.

# In-Tree Support for Incremental Compilation With Clang-Repl

---

# Support For Incremental Compilation

---

Positive outcome for our LLVM community reachout. Adapting mainline LLVM infrastructure started shortly after.

## [llvm-dev] [RFC] Moving (parts of) the Cling REPL in Clang

Vassil Vassilev via llvm-dev [llvm-dev@lists.llvm.org](mailto:llvm-dev@lists.llvm.org)

Thu Jul 9 13:46:00 PDT 2020

- Messages sorted by: [\[ date \]](#) [\[ thread \]](#) [\[ subject \]](#) [\[ author \]](#)

### Motivation

==

Over the last decade we have developed an interactive, interpretative C++ (aka REPL) as part of the high-energy physics (HEP) data analysis project -- ROOT [1-2]. We invested a significant effort to replace the CINT C++ interpreter with a newly implemented REPL based on llvm -- cling [3]. The cling infrastructure is a core component of the data analysis framework of ROOT and runs in production for approximately 5 years.

Cling is also a standalone tool, which has a growing community outside of our field. Cling's user community includes users in finance, biology and in a few companies with proprietary software. For example, there is a xeus-cling jupyter kernel [4]. One of the major challenges we face to foster that community is our cling-related patches in llvm and clang forks. The benefits of using the LLVM community standards for code reviews, release cycles and integration has been mentioned a number of times by our "external" users.

Last year we were awarded an NSF grant to improve cling's sustainability and make it a standalone tool. We thank the LLVM Foundation Board for supporting us with a non-binding letter of collaboration which was essential for getting this grant.

### Background

==

Cling is a C++ interpreter built on top of clang and llvm. In a nutshell, it uses clang's incremental compilation facilities to process code chunk-by-chunk by assuming an ever-growing translation unit [5]. Then code is lowered into llvm IR and run by the llvm jit. Cling has implemented some language "extensions" such as execution statements on

# Support For Incremental Compilation. Clang-Repl

Initial version of the incremental compilation infrastructure landed in LLVM and was released in LLVM 13.

Gradual improvements in every release.

Since LLVM 13, approximately 30 developers have contributed in that area.

The screenshot shows a GitHub commit page for the LLVM project. The commit message is titled "[clang-repl] Land initial infrastructure for incremental parsing". It includes a link to a mailing list post: <http://lists.llvm.org/pipermail/llvm-dev/2020-July/143257.html>. The message discusses plans to make incremental compilation facilities available in the LLVM mainline. It describes a patch for a clang-repl interpreter-like interaction for C++. An example session is shown:

```
./bin/clang-repl
clang-repl> int i = 42;
clang-repl> extern "C" int printf(const char*,...);
clang-repl> auto r1 = printf("i=%d\n", i);
i=42
clang-repl> quit
```

The patch allows very limited functionality, for example, it crashes on invalid C++. The design follows closely the design of cling. The idea is to gather feedback and gradually evolve both clang-repl and cling to what the community agrees upon.

# Clang-Repl Helped Upstreaming Tech. Debt

---

Clang-Repl provided an environment which helps explain and test the custom patches developed in the domain of High-Energy Physics (HEP). Most patches are released via LLVM17.

- ✿ During the project we have upstreamed the essential patches relevant for incremental compilation
- ✿ That lead to faster llvm upgrade cycles in HEP. Time for upgrades went down from approximately 1 year (llvm5->llvm9) to several months from (llvm9->llvm13) to several weeks (llvm13->llvm16).

# Developments Related to Clang-Repl (1)

---

Clang-Repl drove several new developments:

- ❖ Automatic completion at the prompt improving the overall user experience (will be released in LLVM18). See F. Fu's student talk later today.
- ❖ Implement shared memory manager for JITLink enabling efficient out-of-process execution to improve system stability (LLVM15)
- ❖ Program reoptimization. See S. Kim's talk from yesterday.

F. Fu

S. Kim

A. Ghosh

# Developments Related to Clang-Repl (2)

---

JITLink is a library for [JIT Linking](#). That is a component enabling reuse of LLVM as an in-memory compiler by adding an in-memory link step to the end of the usual compiler pipeline.

- ✿ Develop Windows Support (COFF in LLVM16)
- ✿ Develop ARM64 Unix Support (Aarch64 in LLVM16)
- ✿ Develop ARM32 Unix Support based on our ARM64 infrastructure — external contribution
- ✿ Develop RISCV JIT Support (LLVM16)
- ✿ Develop PowerPC Support (ppc64 in LLVM18) — contributed by IBM/Sycomp

S. Kim

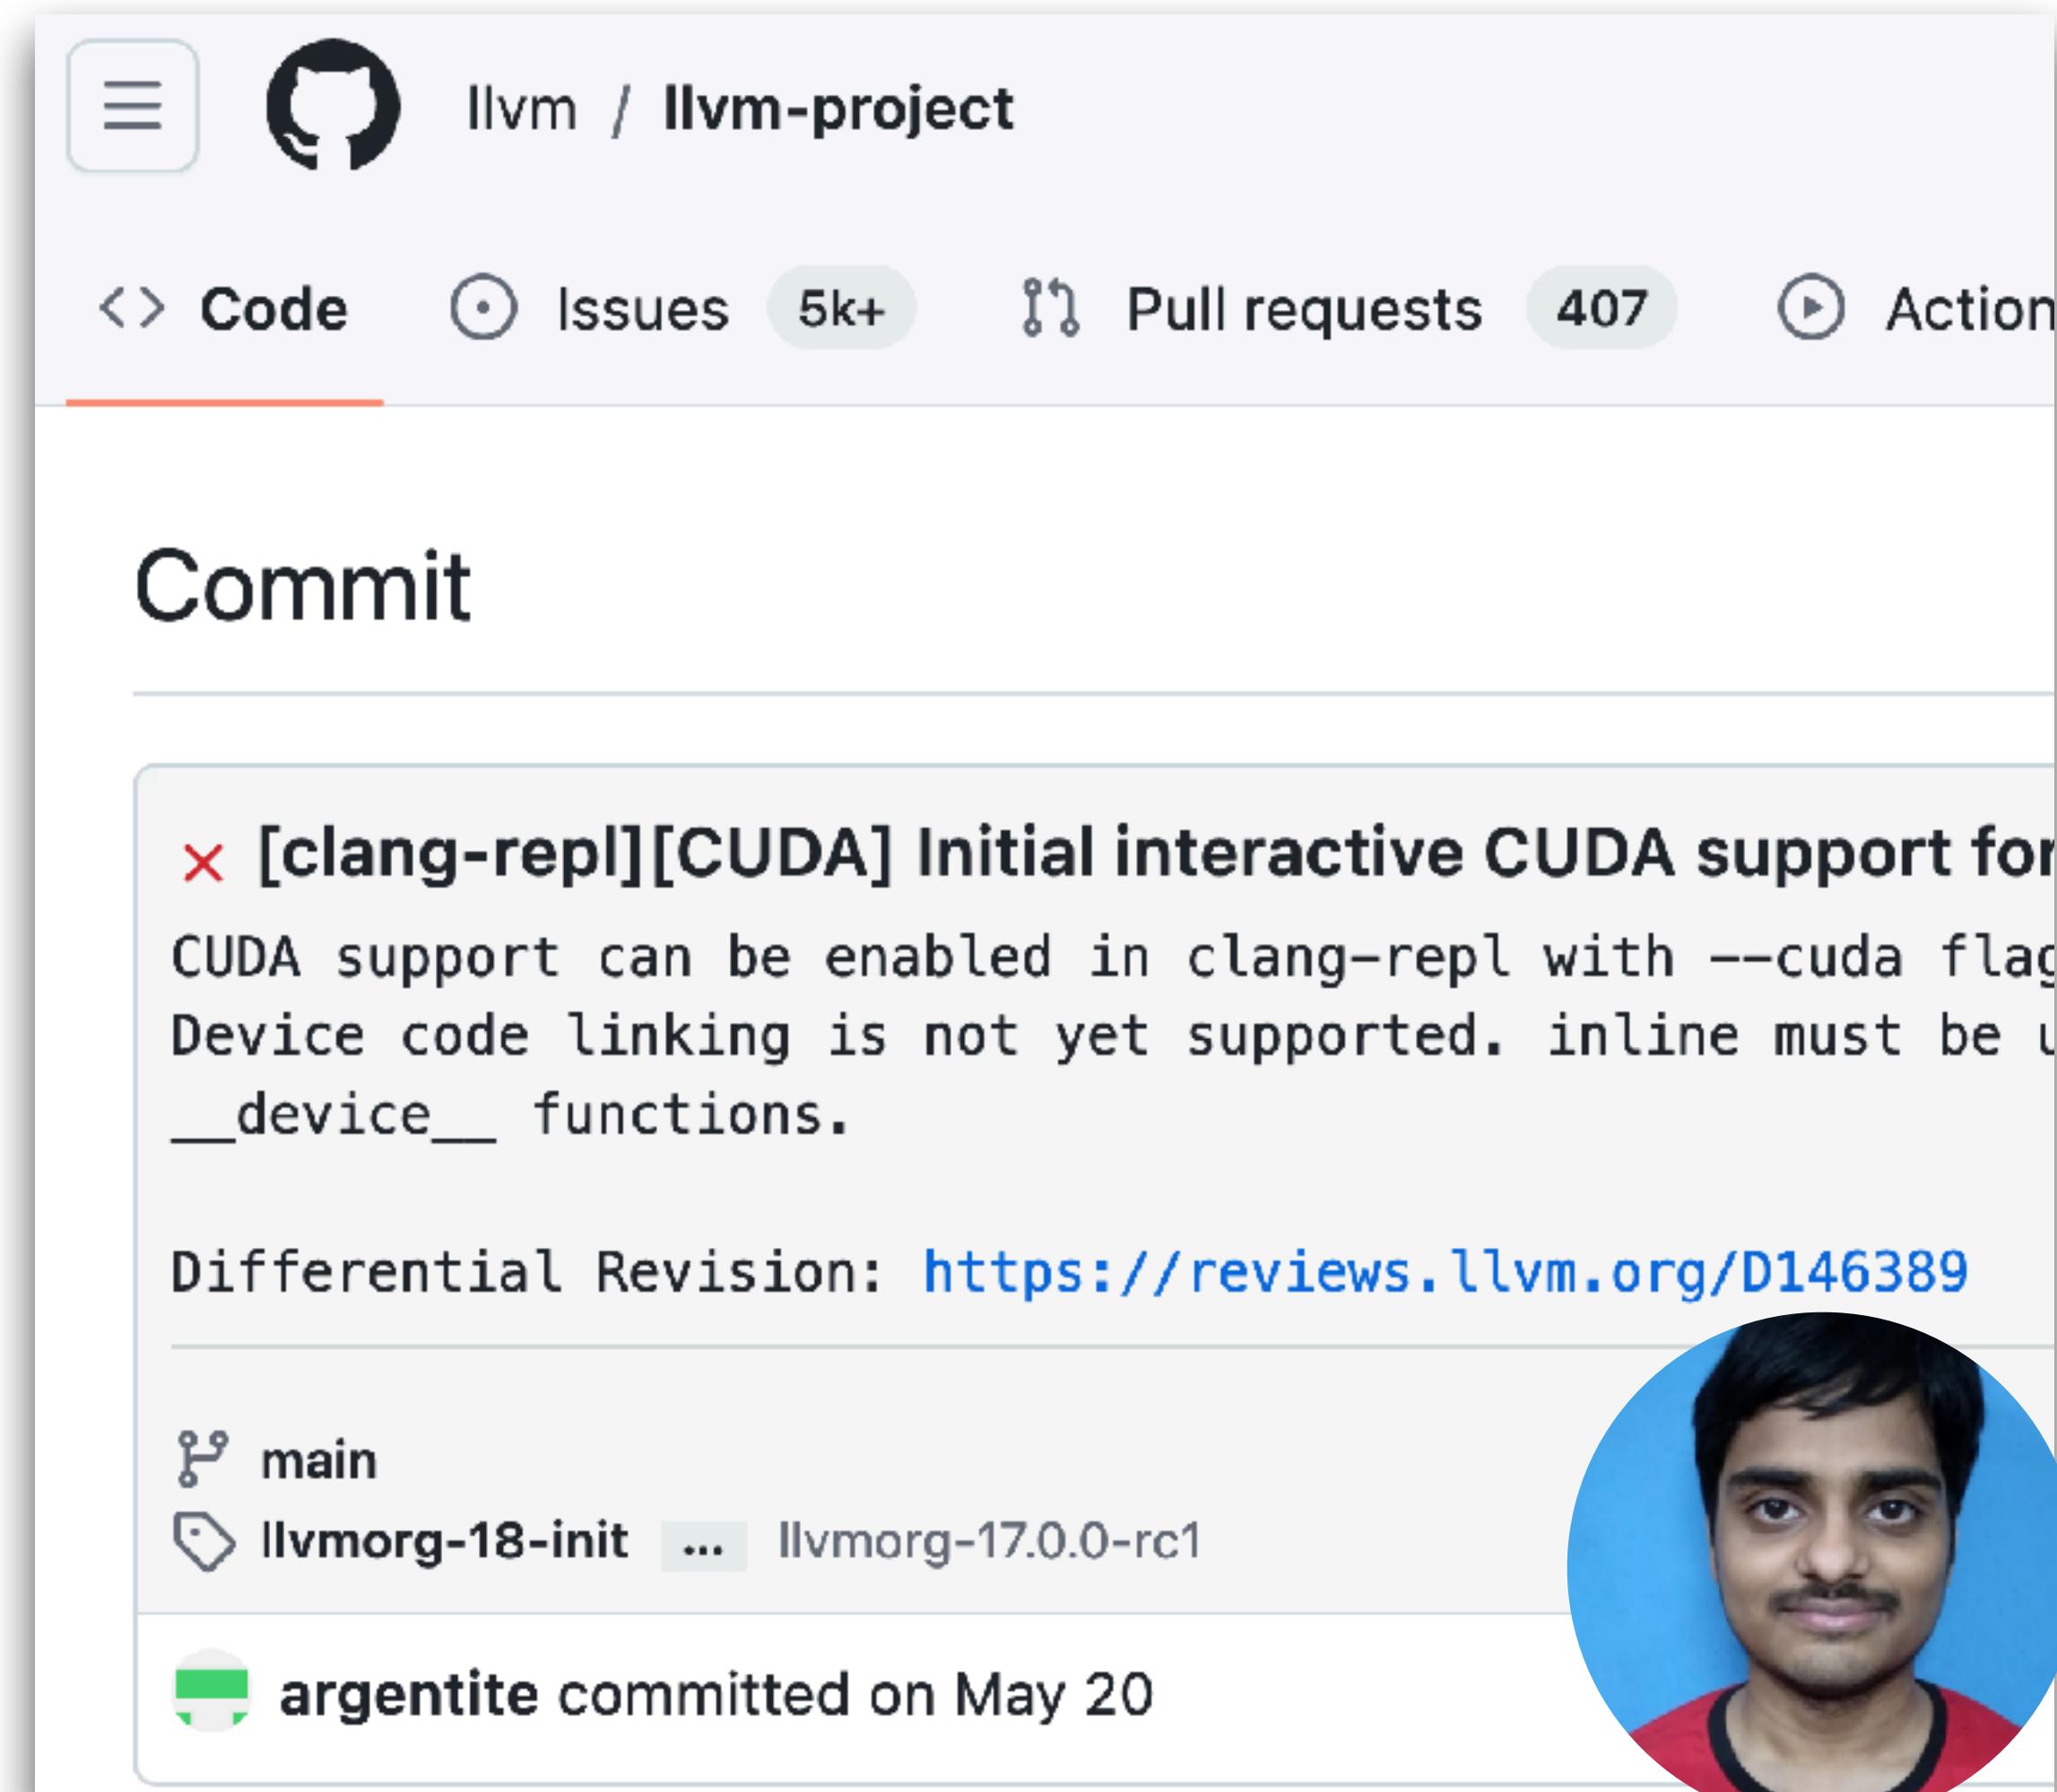

J. Hahnfeld

# Interactive CUDA Support

Implemented a novel approach in interpreting CUDA codes where the PTX is passed through the virtual file system (LLVM17)

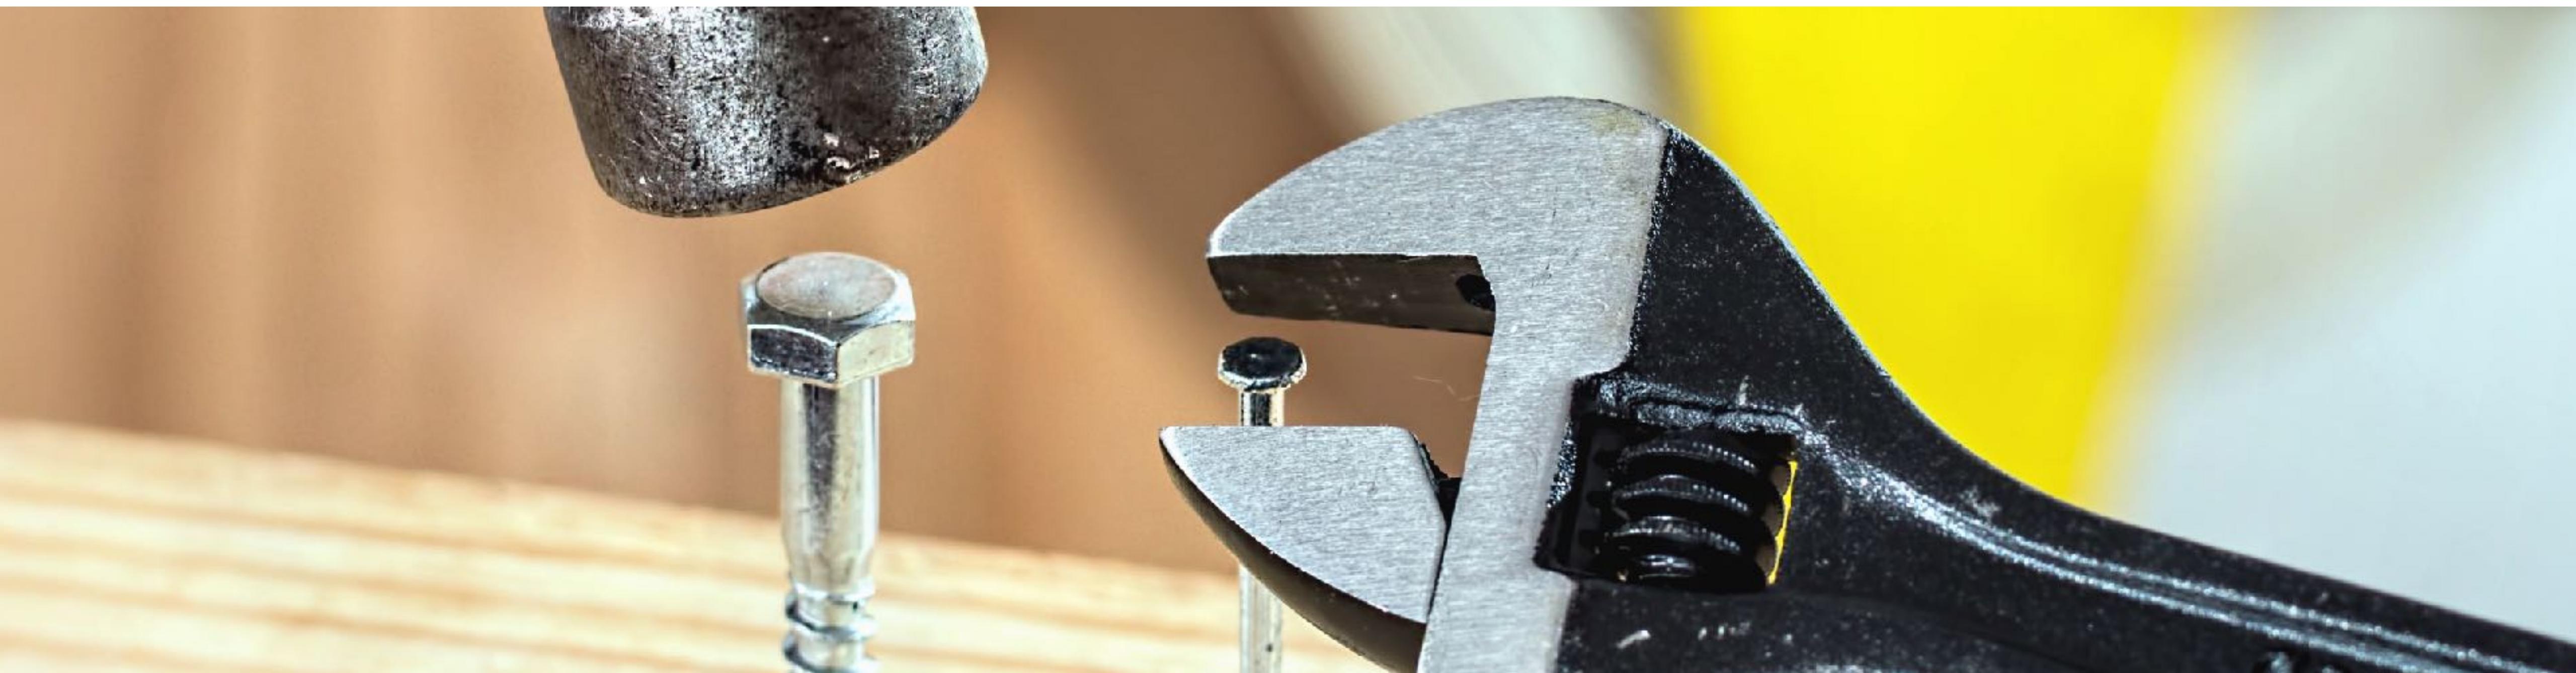

The CUDA engine in Clang-Repl helped discover issues in the mainstream CUDA support in Clang.

A. Ghosh

# Automatic Language Interoperability

---

# Interoperable, Interactive C++ in Jupyter

Crossing the language barrier is expensive

Our Compiler-As-A-Service Approach solves that

In [1]: `struct S { double val = 1.; };`

In [2]: `from libInterop import std  
python_vec = std.vector(S)(1)`

In [3]: `print(python_vec[0].val)`

1

In [4]: `class Derived(S)  
 def __init__(self):  
 self.val = 0  
res = Derived()`

In [5]: `__global__ void sum_array(int n, double *x, double *sum) {  
 for (int i = 0; i < n; i++) *sum += x[i];  
}  
// Init N=1M and x[i] = 1.f. Run kernel on 1M elements on the GPU.  
sum_array<<<1, 1>>>(N, x, &res.val);`

*compiler-research.org's Compiler-As-A-Service Project Final Goal. Shown in the live demo.*

# Clang-Repl in Data Science With Xeus

A. Ghosh

A. Penev

S. Corlay

I. Ifrim

Xeus is a protocol that enables executors to connect to the Jupyter infrastructure:

- ❖ Xeus-Clang-Repl enables incremental C++ with interoperability extensions in Jupyter by implementing the Xeus kernel protocol

# Automatic Language InterOp With Python

---

CPPYY is A CPython/PyPy Extension using their C API. It offers automatic, on-demand mapping of Python to C++ concepts

Every unsuccessful lookup can be completed by a C++ entity connected to a python class wrapper.

```
val = std::vector<int>((1,2,3))
```

While parsing we can associate each construct with a C++ entity. The approach does not require the project maintainer to bother providing static bindings

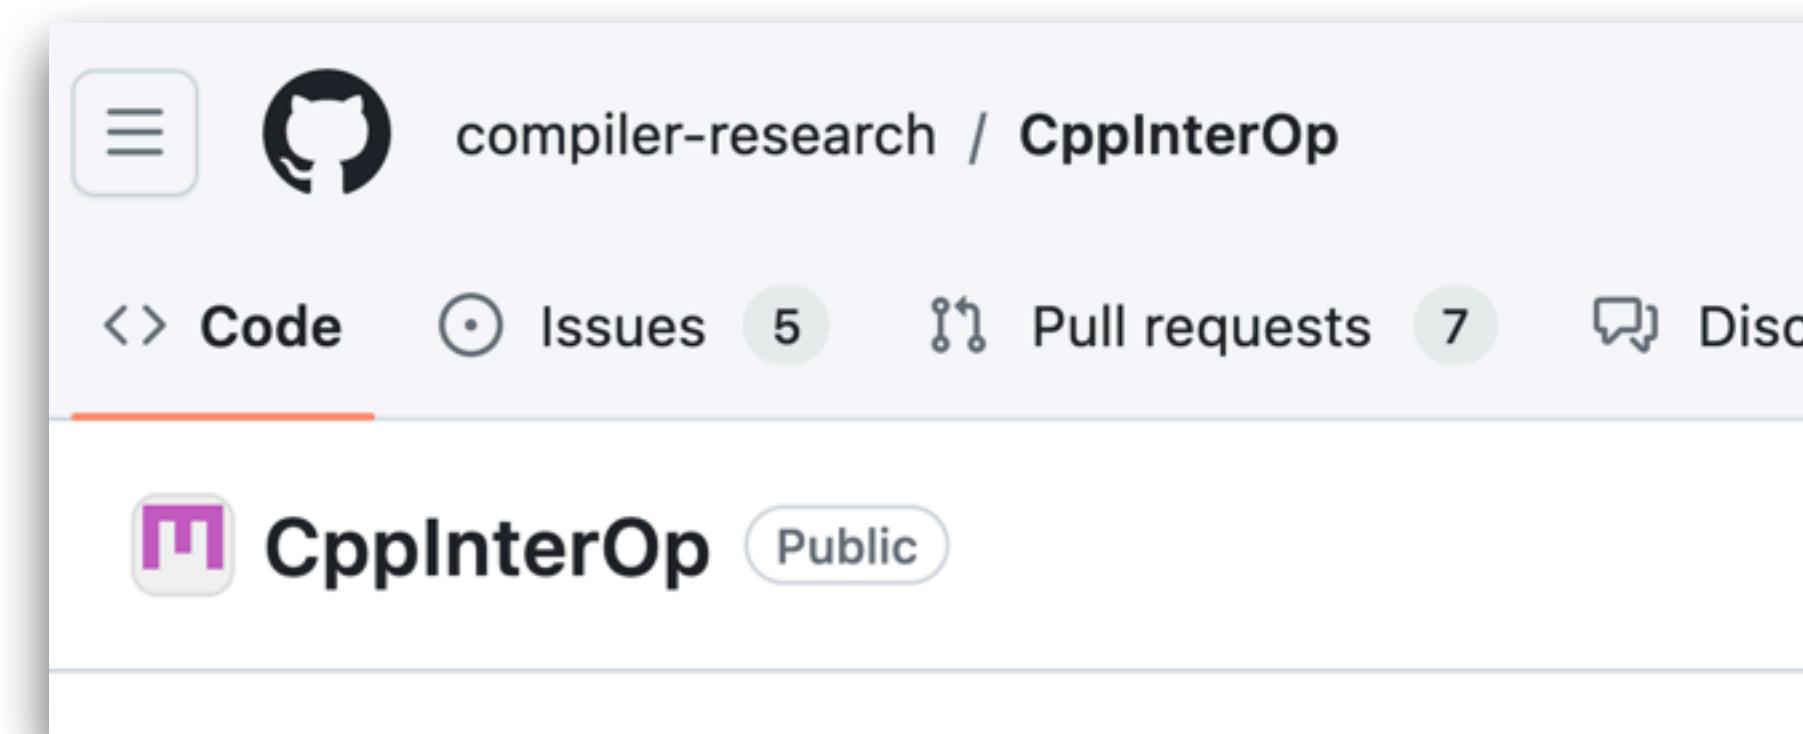

# Moving CPPYY to LLVM Orbit With CppInterOp

---

Provides interoperability primitives for C++ to enable crosstalk in automatic way with Python but also for D, Julia. The library allows replacing the cppyy backend with a specialized and more robust InterOp, moving it closer to LLVM orbit to allow.

# Community Outreach

---

<https://compiler-research.org/vacancies/>  
<https://compiler-research.org/team/>  
<https://compiler-research.org/meetings/>

- ✿ Open, Virtual Weekly Team Meetings
- ✿ Open, Virtual Monthly Meetings
  - ✿ 13 invited talks by speakers from institutions such as Apple, HZDR, QuantStack, Max-Planck, LBL, CERN and EA
- ✿ Student mentoring
  - ✿ 2 Unpaid Contributors
  - ✿ 2 CERN Interns
  - ✿ 4 IRIS-HEP Fellows
  - ✿ 15 Google Summer of Code
- ✿ 3 Technical Documentation Writers via Google Season of Docs

# Compiler (C++) As A Service

# Future Work

---

The funding period is finished but we have plenty of interesting things to pursue in this area:

- ✿ Continue the open meetings policy
- ✿ Continue bug fixing and stabilizing Clang-Repl
- ✿ Continue developing tutorials
- ✿ Reach out to other scientific domains to inform their communities for the new possibilities offered by our innovative software stack!

# Live Demo

---

# Demo: Project Motivation Mockup

- ❖ C++: Create a C++ Struct `S`
- ❖ Python: Create a wrapper class over std::vector instantiated with `S`
- ❖ Python: Print the value of `S`
- ❖ Python: Derive from `S`
- ❖ CUDA: Perform a sum over array and record the result into res.

```
In [1]: struct S { double val = 1.; }; 
```

```
In [2]: from libInterop import std
python_vec = std.vector(S)(1) 
```

```
In [3]: print(python_vec[0].val) 
```

```
1
```

```
In [4]: class Derived(S)
        def __init__(self):
            self.val = 0
res = Derived() 
```

```
In [5]: __global__ void sum_array(int n, double *x, double *sum) {
        for (int i = 0; i < n; i++) *sum += x[i];
    }
// Init N=1M and x[i] = 1.f. Run kernel on 1M elements on the GPU.
sum_array<<<1, 1>>>(N, x, &res.val); 
```

# CaaS. Programming Model

```
// Call an interpreted function using its symbol address.
void callInterpretedFn(clang::Interpreter& interp) {
    // Declare a function to the interpreter. Make it extern "C"
    // to remove mangling from the game.
    clang::Value v;
    interp.ParseAndExecute("extern \"C\" int sq(int x) { return x * x; }"
                           "sq(12)", &v);
    printf("From JIT: square(12)=%d\n", v.getInt());
    auto SymAddr = ExitOnErr(Interp->getSymbolAddress("sq"));
    auto squarePtr = SymAddr.toPtr<int(*)(int)>();
    printf("From compiled code: square(13)=%d\n", squarePtr(13));
}
```

```
// caas-demo.cpp
// g++ ... caas-demo.cpp; ./caas-demo
int main(int argc, const char* const* argv) {
    clang::IncrementalCompilerBuilder CB;
    CB.SetCompilerArgs({"-std=c++20"});
    auto I = Interpreter::create(std::move(CB.CreateCpp()));
    callInterpretedFn(I);
    return 0;
}
```

```
11:15:00-vvassilev~$ ./caas-demo
Hello Interpreter World!
From JIT: square(12)=144
From compiled code: square(13)=169
```

# Interactive C++. Key Insights

- ❖ Incremental Compilation
- ❖ Handling errors
  - ❖ Syntactic
  - ❖ Semantic
- ❖ Execution of statements
- ❖ Displaying execution results
- ❖ Entity redefinition

```
> #include <vector>
> std::vector<int> v = {1,2,3,4,5};

> std.sort(v.begin(), v.end());
input_line_1:1:1: error: unexpected namespace
name 'std': expected expression
std.sort(v.begin(), v.end());
^

> std::sort(v.begin(), v.end());
> v // No semicolon
(std::vector<int> &) { 1, 2, 3, 4, 5 }

> std::string v = "Hello World"
(std::string &) "Hello World"
```

# Demo: JupyterLite

A. Ghosh

# Broader Impact

---

The project developed technical and human capital in the intersection of compiler and data science. It connected domain scientists to the LLVM community via core technologies fostering synergies and collaborations with industry.

The project helped develop 27 young professionals from 11 different countries some of who went to prestigious academic and industrial institutions such as UCSD, ETH Zurich, CERN, Pittsburgh U, IIT and QualComm.
